

ABSTRACT OF THE DISCLOSURE

Provided is a digital broadcast receiving system which facilitates to extract and obtain the information necessary for program recording and reproduction. A packet filter (2) allows to pass a packet for transmitting the moving picture and voice data related to the program to be recorded, and a packet for transmitting a PSI table, but it does not allow to pass a PMT related to programs other than the program to be recorded. An information table generator (7) generates a PAT containing only the information on the program to be recorded. A new PSI table generated by the information table generator (7) is inputted to an information table substitution unit (3), by which a PSI table contained in the packet stream passing through the packet filter (2) is substituted for the new PSI table.
